

Better Material Secures Your Lights

The security of valuable assets is always a concern, and this includes the components of your landscape design. Meteor cares about your concerns and constantly looks for new design innovations to incorporate into its lights. To ensure the security of Meteor lights in your landscape project, they are now assembled with an exclusive new screw design. The new screws cannot be removed from the rim/ frame with an ordinary screwdriver, and their shape adds a decorative touch. With product orders after Jan. 2010 you will receive a special installation tool for these screws included in the purchase price.

While the anchor plates are already theft-resistant, we have increased their security and durability by upgrading their construction. They are now made entirely of SUS304 stainless steel. As the plates are designed to fix the lights securely in place and to prevent weather conditions from affecting the light, this material upgrade will allow the lights to last longer, exactly where you want them. When it comes to your outdoor lighting, there's no need to worry. Meteor has everything covered.

Meteor will continue to improve with your continued support and suggestions. Please contact Susan at skim@meteor-lighting.com with any inquiries.
